

After the groundwater table has been lowered from close to the surface, great storage capacity will exist in the underground aquifer. Under these conditions, which are the reverse of the canal seepage cases, it would be most beneficial to facilitate seepage into the ground. Studies of the flow characteristics of the ground, recharge rates, canal design and management to maximize seepage, and field experimentation are needed to determine the feasibility of developing underground storage reservoirs.

### Education and Training

It goes without saying that the execution of the agricultural development program will require the services of a large number of men who possess substantial technical and administrative skills. Such men are scarce in Pakistan. The development of an adequate corps of technically and administratively trained men must be an integral part of the agricultural development program. No enduring improvement in productivity can be attained unless a widespread effort in this direction is carried on. The administration of the program must be designed to afford opportunities for training and education at many levels.

In-service training there will be, nolens volens. In addition the agricultural development program will afford opportunities for an extensive internship program to be carried out in cooperation with the agricultural colleges and universities. There will be much useful work for the interns to perform, and their education will benefit greatly from contact with field problems and from contacts with the permanent staff of the development program.

Every opportunity should be taken to involve young Pakistanis in the work of the project area administrations. This is the best way to arouse interest, hope and spirit in an emerging country. It will draw the attention of Pakistani youths to urgent problems at home where they can make important personal contributions. Their horizons will be broadened and their enthusiasms kindled by working side by side with young foreign personnel such as members of the Peace Corps.

The research activities of the development program should be carried on in close collaboration with related endeavors at the colleges, universities, and technical institutions. Faculty members at educational institutions should be employed as consultants and as full-time workers between semesters. The results of research carried on under the auspices of the development program should be announced at seminars at the universities and should be published through the university journals and monograph series.
