Sunoco-Felda Field

The second and newer of Florida's two oil fields is the Sunoco-Felda field of Hendry County, south Florida, shown on figure 1, which officially was opened to production by the Sun Oil Company on October 9, 1964.

Table 1 shows that a total footage of 276,558 feet were drilled in this field in 24 wells that were terminated in 1965; data sheets on these wells are included in appendix 1. Of this footage, 218,434 feet were drilled in 19 oil wells yielding a combined initial production of 3,846 BOPD (barrels of oil per day); and 58,124 feet were penetrated in 5 dry holes. These dry holes, which are the only failures drilled to the present time, delineate the field to the west, south and east.

Currently the operator is drilling at 3 new field locations. These wells are not included in table 1 and appendix 1, but will be included in the 1966 compilations.

The Sunoco-Felda field produces on pump from the Roberts zone, which occurs about 65 feet below the top of the Sunniland Limestone- (defined by Paul L. Applin, 1960, p. 209) of Early Cretaceous Age. The Roberts zone consists of microfossiliferous (miliolitic) limestone reached at depths ranging from about 11,462 feet to 11,495 feet. It appears that a permeability trap is responsible for oil accumulation in the field. The producing interval in up-dip wells to the north is tight and yields a large percentage of salt water.

Yields from the better wells in the field range from 320 BOPD to 355 BOPD on pump. During the month of December, 1965, the field produced 97,342 barrels of oil with an estimated 53,000
barrels of salt water from 22 pumping wells. Cumulative production from the field since its discovery, October 9, 1964, through December 31, 1965, was 706,218 barrels of oil.

The Sun Oil Company reports that to date in excess of five million dollars have been spent in developing the Sunoco-Felda field.

Sunniland Field

The Sunniland oil field (fig. 1), discovered in 1943 and operated by the Humble Oil and Refining Company, is located 18 miles south of the Sunoco-Felda field.

As shown on table 1, a total of 26,156 feet were drilled in two Sunniland field wells completed in 1965; data sheets on these wells are included in appendix 1. Both of these tests were completed in the latter part of the year as flowing wells with initial productions of 562 BOPD and 464 BOPD, respectively. One of these holes, the Humble No. 24 Gulf Coast Realities Corporation well, was drilled to 14,500 feet of depth, and is the deepest well drilled to date in the field.

Production from the Sunniland field is primarily from a part of the Sunniland Limestone which contains disoriented macrofossils (rudistids), and which is reached at depths ranging from about 11,548 feet to 11,567 feet. Productive zones occur in an interval extending from the top of the Sunniland Limestone to a point about 75 feet deeper in the section. The lowermost of the four main productive zones in the Sunniland field is correlative with the productive Roberts zone in the Sunoco-Felda field.

During the month of December, 1965, this field produced 83,978 barrels of oil from 13 pumping wells and 2 flowing wells. The cumulative production from the field through December 31, 1965, is 9,125,916 barrels of oil. At the present time it is thought that 25 to 35 million barrels of oil probably is a reasonable figure for the initially recoverable reserves of the field.

EXPLORATION

Exploratory Drilling

As recapitulated in table 2, a total of 34,586 feet were drilled in six exploratory wells in 1965 (see figure 1 for locations); all of these wells have been plugged and abandoned. Well data sheets on these tests are included in appendix 1. Five of these wells were located in northern peninsular Florida and tested the Upper

Cretaceous section, with one of them, the Thayer-Davis, No. 1 Ripley test in Columbia County, continuing deeper to penetrate 2,172 feet of Paleozoic rock. This was the third well in the State to drill a considerable thickness of the Paleozoic section.

The sixth exploratory test in 1965 was the Serio No. 1 State Lease 1939-1939S well, which was located in Dade County, south Florida about 3,300 feet north of the discovery well for the abandoned Forty Mile Bend field, and which reached a depth of 11,612 feet. Core recovery from the upper Sunniland zone contained a slightly oil stained interval from 11,347-11,382 feet. A drill stem test recovery in 4 hours consisted of 615 feet of salt water with slight oil staining. Coring at 11,452-11,502 feet in the lower Sunniland zone revealed bleeding oil in very small fractures; the lower Sunniland zone was not drill stem tested.

Exploratory wells still drilling at the end of 1965 are not included in table 2 and appendix 1, but will be embodied in 1966 compilations. The following information on these tests was available at the end of the year:

1. The Sun Oil Company, No. 15-3 Consolidated Financial Corporation well is located as an outpost about $\frac{1}{4}$ miles northeast of the Sunoco-Felda field, and has a proposed depth of 11,600 feet. At the end of the year this well was drilling at approximately 11,000 feet.

2. The Southern Triangle Oil Company No. 1 Lawless, et al well, is located in Hendry County about 5½ miles west southwest of the town of La Belle, and 12 miles north northwest of the Sunoco-Felda field. The proposed depth of this well is 13,500 feet, and drilling commenced December 30, 1965.

3. The Jett-Phillips No. 1, The Buckeye Cellulose Corporation, et al well, located in Lafayette County in northern peninsular Florida, with a proposed depth of 6,000 feet, was waiting on orders at a depth of 5,270 feet as of the year's end.
Proposed Exploratory Drilling

The Mobil Oil Corporation is committed to the drilling of two exploratory tests in 1966. One well will be located on state offshore acreage farmed out from Coastal Caribbean Oil and Minerals, Ltd., lessee. A primary objective of this test will be the Lower Cretaceous section; the Sunniland Limestone should be reached at about 11,200 feet. The other well, which also will be a Lower Cretaceous test, will be drilled on private land owned by the Babcock-Florida Corporation and located in Charlotte and Lee counties. Mobil acquired the right to drill on this acreage under the terms of an agreement with the Gulf Oil Corporation, lessee.

Geophysical Activity

During 1965 geophysical operations, though credited with little success in the past, were increased in the hope that new techniques will be successful. Mainland activity has included 37 weeks in South Florida (in Hendry, Collier, Lee, Highlands and DeSoto counties), and 24 weeks in the northwestern part of the State (in Escambia, Santa Rosa, Okaloosa, Gulf and Franklin counties).

Nine permits for offshore geophysical work, consisting primarily of seismographic activity, were granted in 1965. Figure 2 shows the permit numbers; type of geophysics to be performed; operator, contractor and permittee for each permit; in some cases the crew weeks of work completed; and the general localities of the proposed activity.

New Alabama Field Near Northwestern Florida

Fifteen miles west northwest of the northwestern tip of Florida (fig. 1) and in Baldwin County, Alabama, the Lee No. 1 Smith well was completed November 16, 1965 as a producer from the Paluxy Sand. On the initial production test through perforations at 8,382-8,387 feet, this well flowed through a 7/64-inch choke, 20 BOPD with a fluid gravity of 16 degrees. Open tubing pressure was 30 psi; shut-in tubing pressure, 418 psi; gas-oil ratio, 100 to 1. The location of this well is: 808 feet from the west line; 660 feet from the north line; Sec. 3, T 1N, R 2E.
Figure 2. Florida offshore geophysical permits issued in 1965.

RULES AND REGULATIONS

State Board of Conservation Order No. 1 provided, temporarily, for a spacing of 160 acres for oil wells producing from the Roberts zone of the Sunoco-Felda field. This order was to remain in effect one year terminating December 15, 1965, with a provision for an extension, upon request, of an additional six months to enable the Sun Oil Company to acquire more complete geological and engineering information relative to the drainage characteristics of the field. Such a request was made by the company, and consequently Temporary Order No. 1 was extended to May 6, 1966, at which time there will be a final hearing to set permanent spacing rules.
State Board of Conservation Order No. 2, dated July 20, 1965, provided that brines produced by the Sunoco-Felda field shall be injected into a disposal well below a packer set at 2,270-2,290 feet, through 2 7/8-inch tubing into highly permeable rock containing very saline formation waters (16,000 ppm chloride ions). Such injection would not be harmful to surface areas.

On December 9, 1965, the State Board of Conservation heard testimony in connection with the application of the Humble Oil and Refining Company to dispose of waste salt water produced in the Sunniland field by injection to a depth below 2,900 feet. Additional written briefs will be received in connection with this hearing to assist the Board in rendering a decision on this application.

Location:
Sec. 18 - T48S - R30E (100' N of the center of the SW/4 of the SW/4 of the section)

Subsurface record:

(1) Sunniland field producing well. The initial production was 584 BOPD, with 44 barrels of water through perforations of 4 shots per foot over the interval, 11,576-11,590'.

(2) Casing program:
20" at 180' w/375 sacks
13 3/8" at 1,045' w/890 sacks
9 5/8" at 3,650' w/400 sacks
5 1/2" at 11,654' w/450 sacks of Slo-Set

(3) Logs:
Induction-Electrical, 3,648-11,652'; Acoustilog, 3,648-11,651'; Gamma Ray-Neutron, 3,648-11,653'

(4) Conventional cores:
a) No. 1, at 11,540-11,546', Recovered 3 1/2'
b) No. 2, at 11,546-11,562', Recovered 13'
c) No. 3, at 11,563-11,593', Recovered 30'
d) No. 4, at 11,593-11,623', Recovered 30'

(5) DST: None
Location:
Sec. 24 - T48S - R29E (1,980' S and 660' W of the NE corner of the section)

Subsurface record:

(1) Sunniland field producing well. The initial production was 464 BOPD with 40 barrels of salt water through penetrations of 4 shots per foot at 11,583-11,590' (Induction-Electrical Log), and after acidation with 300 gallons of MCA.

(2) Casing program:
Set 20" at 192' with 350 sacks of cement
Set 13 3/8" at 1,387' with 650 sacks of cement
Set 9 5/8" at 3,695' with 350 sacks of cement
Set 7" at 11,700' with 450 sacks of cement

(3) Logs:
Gamma Ray-Neutron, 3,696-11,704'. Sonic, 11,705-13,490'; Borehole Compensated Density, 8,000-11,704'.

(4) Conventional cores:
Core 1. 11,545-11,575'
Core 2. 11,575-11,605'
Core 3. 11,605-11,635'
Core 4. 12,569-12,599'

(5) Sidewall cores:
Attempted 17 sidewall cores from 8,235-11,667'; recovered 17.

**Location:**

Sec. 32 - T45S - R29E (700' FNL, and 1,318' FWL of the section). This was a revised location; the rig originally on the No. 32-2 R. C. Co. well, in which the hole was lost, was skidded over 500', and the same permit number assigned to this location.

**Subsurface record:**

1. Sunoco-Felda field producing well. The initial production was 115 BOPD, with 79 barrels of water from the open hole at 11,486-11,493'. There was no acid treatment of this hole prior to this test.

2. Casing program:
   - 30" at 40'
   - Set 20" at 188' with 300 sacks
   - Set 13 3/8" at 1,320' with 650 sacks
   - Set 9 5/8" at 3,491' with 200 sacks
   - Set 5 1/2" at 11,486' with 300 sacks of Slo-Set cement

3. Logs:
   - Induction-Electrical, 3,489-11,488'

4. DST: None

(Sept. 5, 1965)

Location:
Sec. 32 - T45S - R29E (1,800' FSL and 700' FEL of the section)

Subsurface record:

(1) Sunoco-Felda field producing well. The initial production was 306 BOPD with 21 barrels of salt water from the open
hole at 11,459-11,471' after acidation with 1,000 gallons of 15% HCL with CRA-10.

(2) Casing program:
Drove 20" to 82'
Set 13 3/8" at 1,155' with 650 sacks
Set 9 5/8" at 3,405' with 200 sacks
Set 5 1/2" at 11,459' with 200 sacks of Slo-Set cement
Ran 2 1/2" tubing to 4,565'

(3) Logs:
Gamma Ray - Neutron, 3,400-11,473'

(4) DST's:

a) 1,286-1,336'. Chokes, none. Open 30 minutes. Working pressure, 0 pounds. Recovery, 100' of drilling mud,
and 466' of filtrate water. Bottom hole flowing pressures, 144 psi and 288 psi. Bottom hole closed-in pressures,
532 psi and 523 psi.

b) 1,434-1,463'. Chokes, none. Open 1 1/2 hours. Working pressure, 0 pounds. Recovery, 60' of drilling mud,
and 1,190' of water. Bottom hole flowing pressures, 282 psi and 543 psi. Bottom hole closed-in pressures, 599 psi
and 698 psi.

c) 1,760-1,799'. Chokes, none. Open, 1 hour. Working pressure, 0 pounds. Recovery, 1,700' of salt water.

APPENDIX II
The locality and well numbering system is based on the location of the locality or well, and uses the rectangular system of section, township, and range for identification. The number consists of five parts. These are: 1) a prefix of three letters designating L for locality or W for well and county abbreviation, 2) the quarter/quarter location within the section, 3) the section, 4) the township, and 5) the range.

The basic rectangle is the township which is 6 miles square. It is consecutively measured by tiers both north and south of the Florida base line - an east-west line that passes through Tallahassee. This basic rectangle is also consecutively measured both east and west of the principal meridian - a north-south line that passes through Tallahassee. In recording the township and range numbers, the T is left off the township numbers, and the R is left off the range numbers. Each township is divided equally into 36 square miles called sections, and are numbered 1 through 36 as shown on the attached diagram.

The sections are divided into quarters with the quarters labeled "a" through "d" as shown on diagram. In turn, each of these quarters is divided into quarters with these quarter/quarter squares labeled "a" through "d" in the same manner. The "a" through "d" designation of quarters may be carried to any extent deemed useful.

The location of the well WLn-2N-2E-21 db shown on the diagram would be in the center of the southeast quarter of the northeast quarter of section 21, township 2 north, range 2 east.

When there is more than one well or locality in a square 40-acre tract (quarter/quarter section) they are identified by either an additional quarter designation or by a sixth arbitrary accession number at the end of the range unit. The abbreviations used for counties are:
