Figure 25. Possible recombination between Bt2 and Bt2-like. 
A: Schematic representation of nonhomologous recombination between Bt2 and Bt2-like. The symbols are described in the legend to Figure 23. Note that the recombinational product, recombined bt2-7503 contains wild type exon sequences and Bt2-like intron sequences. B: Nucleotide sequences across the recombination junction. (a): Nucleotide sequence of Bt2; (b): nucleotide sequence of Bt2-like; (c): nucleotide sequence of recombinational product. Vertical line represents the nucleotide match. Asterisk indicates the junction between exon and intron.
