Within the Southeast Region of the National Park Service there are 19 units that are subject to erosion by salt or brackish waters. Of these, at least seven are considered to be mildly to highly susceptible to dredging effects.

Table 6 lists the NPS units in the SE region which fall within the classification above, i.e. either subject to erosion by salty or brackish water or are possibly subject to adverse effects of dredging. An attempt has been made to rank the effects of dredging as Low (L), Medium (M), High (H) and extremely high (EH). This ranking is based on the proximity of planned or past dredging activities and the impact on the site.
