areas, the connection between various water plants and mosquitoes, the seasonal periodicity of mosquitoes, the possibilities for control of the water level, and the best location of housing.

Schulz's survey is of great importance for Surinam's Brokopondo project in that it stresses: (1) the possible influence of ecological and health factors on the technical and economic problems which are under examination, (2) the need for widespread and careful investigation of those factors, and (3) the necessity of giving full consideration to them, also at this early stage, in the study of the whole project.
